Dynamics of the land fund: how the land resources of Ukraine changed after February 24, 2022

The RF's military invasion of Ukraine, military actions, and the occupation of the territories led to significant pollution of the Ukrainian agricultural land and made it impossible to use these lands in agricultural production for many years after the end of the military conflict.

To assess the resource potential and forecast the development of the agricultural sector of the country's economy, it is necessary to assess the consequences of the war, in particular, to determine the area of land that became inaccessible due to military aggression. Inaccessible lands are the territories occupied by the aggressor country before the February 24, 2022, territories of troop transfer since February 24, 2022, occupied and de-occupied territories and lands contaminated by mines¹.

As part of a joint initiative of the Polissya National University, the KSE Agrocenter and the National University of Life and Environmental Sciences of Ukraine, a study was conducted, the purpose of which is to clarify the area of the land fund of Ukraine as a whole and in terms of its individual components (namely: forests and other wooded lands, agricultural lands, including arable land and fallows, hayfields and pastures) taking into account the consequences of occupation, mining and conducting active combat operations.

The research uses data from the ecological passports of the administrative regions of Ukraine² and the results of joint research by the World Bank, the Government of Ukraine, the European Commission, and the United Nations regarding the assessment of damage and losses suffered by Ukraine in the period from February 2022 to February 2023 as a result of the full-scale invasion of the Russian Federation³. The relevant calculations are based on the assumption that the specified types of land are evenly distributed within the territories of the administrative regions of Ukraine.

Results

According to the study made by the World Bank, the Government of Ukraine, the European Commission, and the UN, regions with the largest share of territory affected by the full-scale invasion of the Russian Federation in 2022 are Luhansk (100%), Kherson (95%), Chernihiv (80%), Zaporizhia (74%), Sumy (70%) and Donetsk (64%) oblasts **(Fig.1)**.

In general, the share of the territory of Ukraine affected by occupation, mining and hostilities in the total area of the country was 31.74% **(Table 2, Appendix)**. The area of affected agricultural land in 2022 was 10514.13 thousand ha, and the area of land that could be used for agricultural activities that year was 32924.00 thousand ha, which is 26.04% less compared to the area before the beginning the full-scale invasion. The area of arable land and fallow land, which did not undergo changes during the RF military aggression, was 22280.45 thousand hectares, which is 31.93% less than before the start of the invasion. The area of hayfields and pastures decreased by 43.45%, primarily due to the fact that the largest share of these lands is concentrated in the regions most affected by military actions - from 17.5% in Chernihiv Oblast to 21.88% in Luhansk Oblast. As of forests and other wooded lands, their area compared to the pre-war period decreased by 26.05% from 10686.6 to 7903.03 thousand hectares.

Figure 2. The amount of available land after the invasion, in thousands of hectares

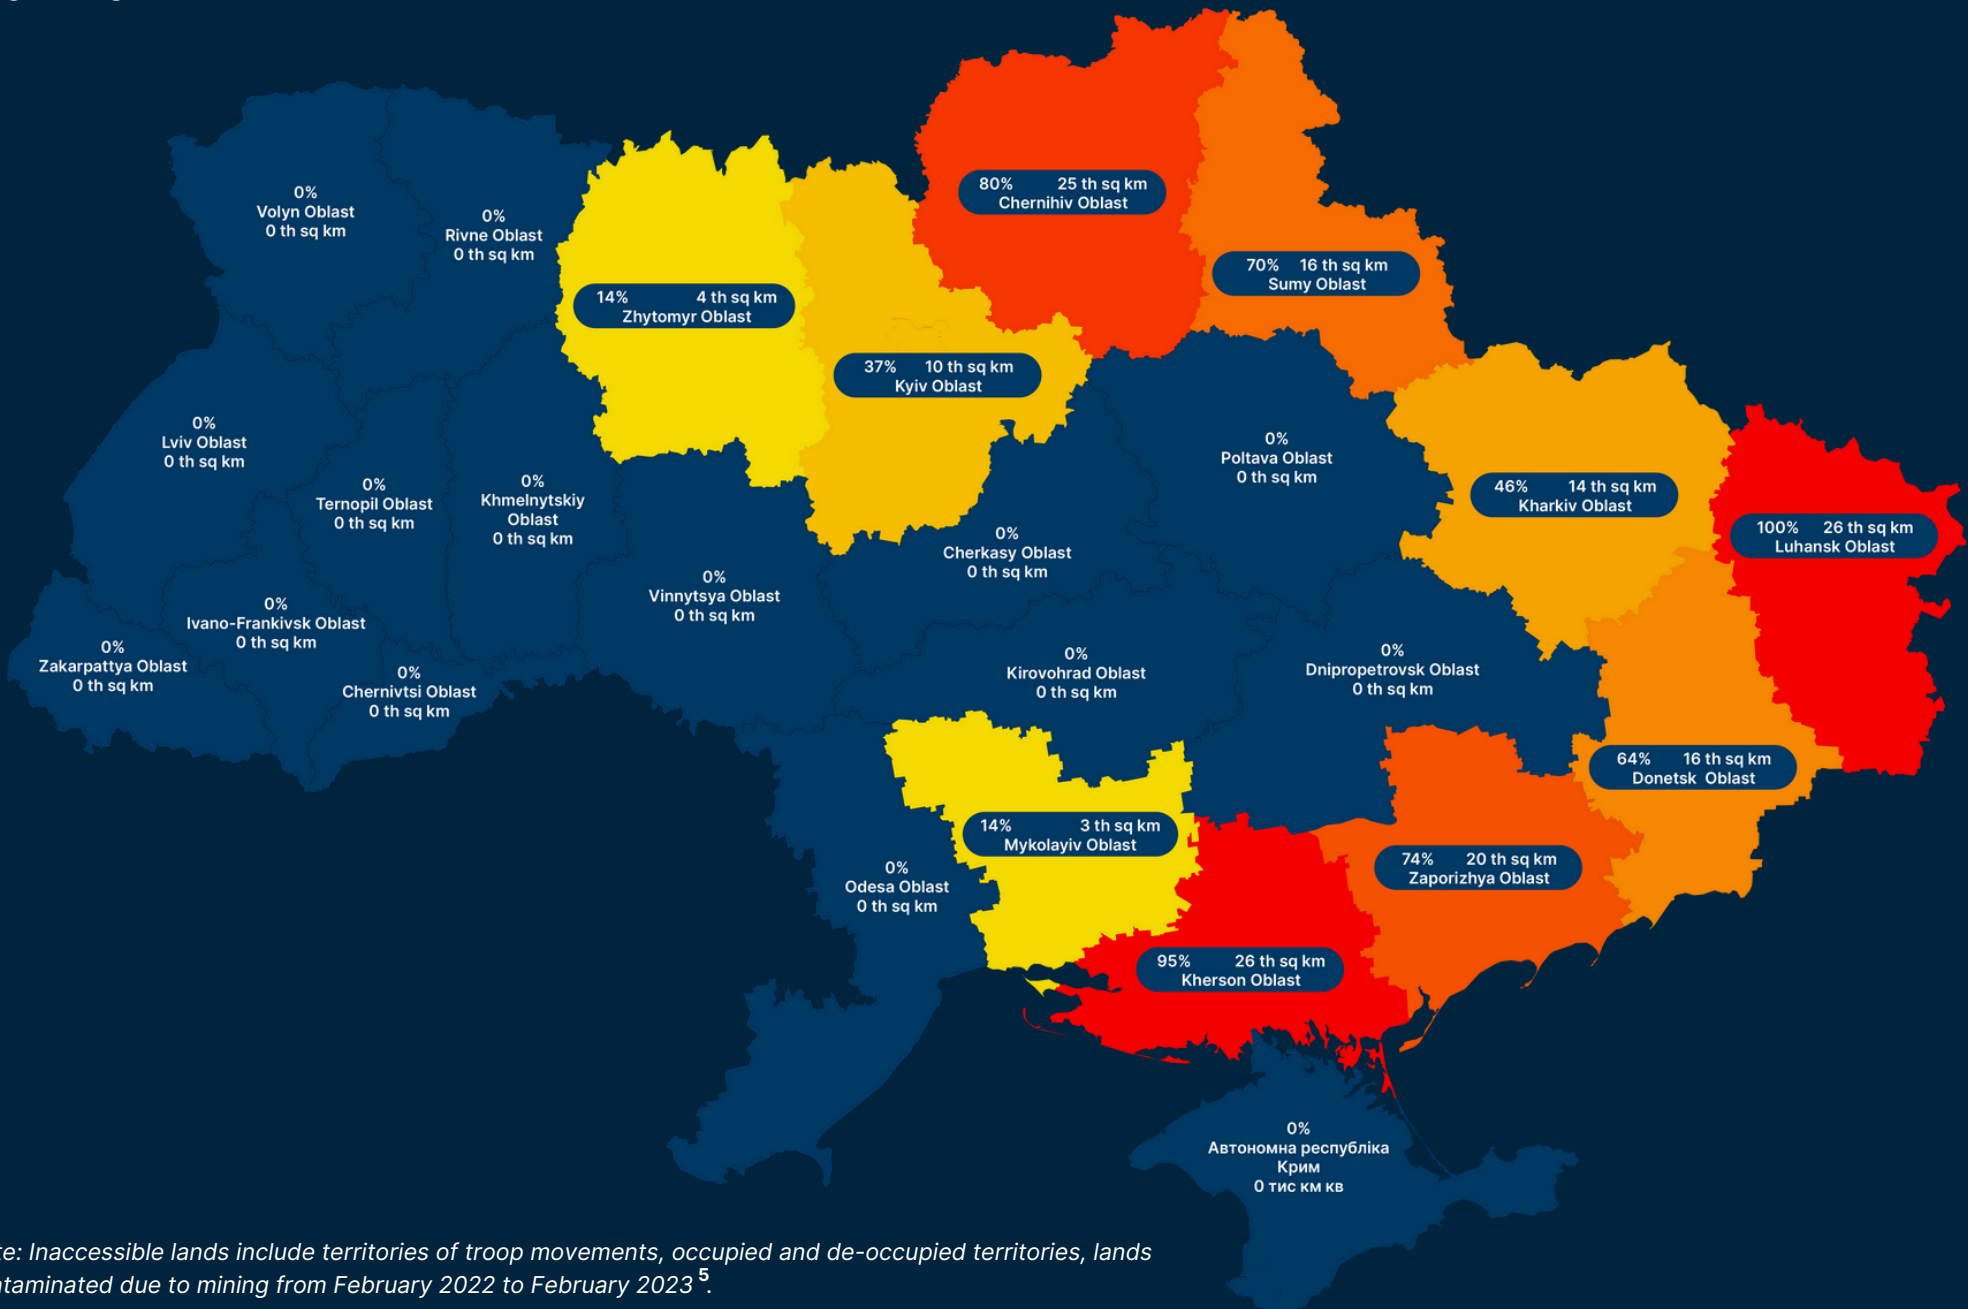

Note: Calculated as of beginning of 2023.

Source: Calculated according to the data of ecological passports of administrative regions of Ukraine ⁴

Figure 1. Inaccessible lands as a result of the military aggression of the Russian Federation, by regions, as of the beginning of 2023.

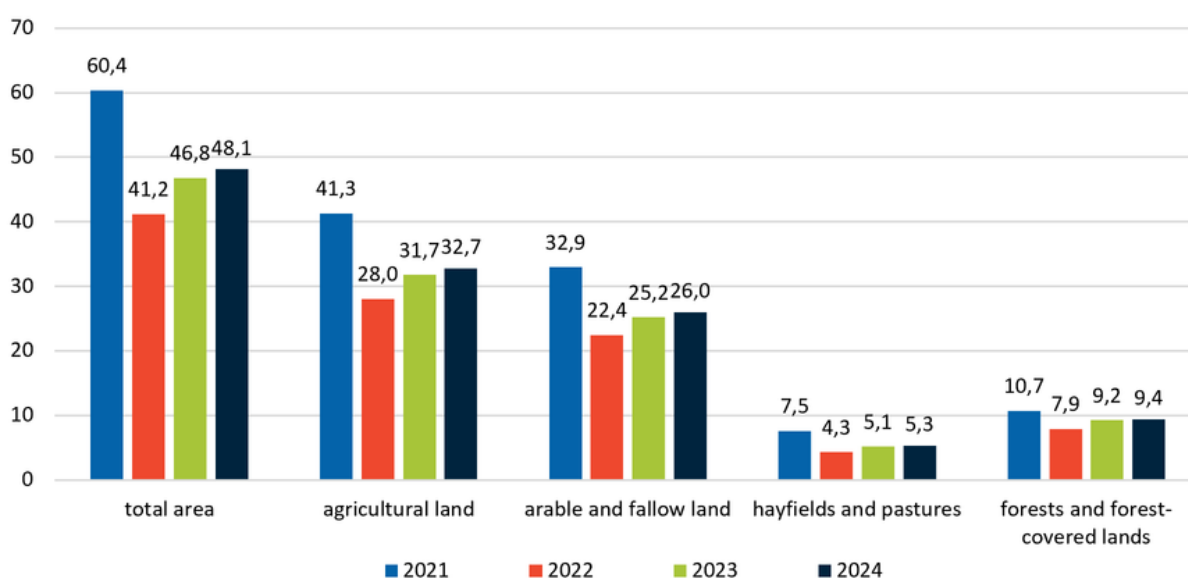

Note: Inaccessible lands include territories of troop movements, occupied and de-occupied territories, lands contaminated due to mining from February 2022 to February 2023⁵.

[5] built on data [<https://mepr.gov.ua/diyalnist/napryamky/ekologichnyj-monitoryng/ekologichni-pasporty/>, <https://ukraine.un.org/sites/default/files/2023-03/P1801740d1177f03c0ab180057556615497.pdf>]

As a result of the successful actions of the Armed Forces of Ukraine in 2022 and at the beginning of 2023, the territories of Kyiv, Zhytomyr, and Chernihiv regions were deoccupied; part of the lands of the Mykolaiv and Sumy regions were also returned, however, 3 and 15% remained under occupation, respectively. As a result, in 2023, the total area of Ukraine's land resources, excluding occupied territories, zones of active combat operations, zones along the Ukrainian-Russian border and other territories where economic activity is impossible, increased by 13.58% to 46787.98 thousand hectares, compared to 2022. In particular, the area of agricultural land increased by 13.19% (including due to the increase of arable land and fallow land by 12.31%), and the area of forests and wooded land - by 16.73% (**Fig. 3**).

Figure 3. Dynamics of land resources of Ukraine in 2021–2024, millions of hectares

As of the beginning of 2024, the area of the territories of Ukraine suitable for conducting economic activity amounted to 48109.77 thousand hectares, that is, it increased by 16.78% compared to 2022 and by 2.83% compared to 2023 due to the deoccupation of a part Kharkiv and Kherson regions. The area of forests on wooded lands increased by 18.53% compared to 2022, agricultural land - by 16.69%, in particular arable land and fallow land - by 15.31%, hayfields and pastures - by 24.07%.
